Background
• Antagonism of the interaction between the cellular adhesion integrin α4β7 and MAdCAM-1 has proven to be safe and effective in the treatment of Crohn’s disease (CD) and ulcerative colitis (UC).
• Additional benefit may be gained from an α4β7 antagonist administered via the subcutaneous (SC) route at extended intervals (e.g., every 8 to 12 weeks) during maintenance therapy.

Methods and Results

SPY001 is a novel antibody that binds to the same epitope as vedolizumab

Table 1: SPY001 and vedolizumab dissociation constants (Kₐ) for α4β7 by KinExA and for related integrins by surface plasmon resonance. ¹NB = no binding.

SPY001 demonstrates potent and selective binding to α4β7 in vitro

SPY001 binds to α4β7-expressing peripheral blood mononuclear cells

Figure 1: Binding of SPY001 (or vedolizumab) to α4β7 prevents its association with MAdCAM-1 and is anticipated to inhibit leukocyte trafficking across the endothelium and reduce GI inflammation. Created with BioRender.com.

Figure 2: Predicted binding site for SPY001 and vedolizumab on α4β7.

Figure 3: SPY001 and vedolizumab both inhibit α4β7-mediated cellular adhesion to MAdCAM-1 (left); neither SPY001 nor vedolizumab inhibit α4β1-mediated cellular adhesion via VCAM-1 (right).

Figure 4: Labeled (AlexaFluor-647) SPY001 binds to α4β7-expressing cells isolated from PBMCs (left); competing off AF647-SPY001 with unlabeled SPY001 demonstrates receptor occupancy (right). N=3 donors.

Figure 5: YTE modification extends half-life by increasing IgG binding affinity to FcRn at low pH, increasing antibody recycling and reducing lysosomal degradation (1). Adapted from “extracellular vesicles” by BioRender.com (2023).

Conclusions
• SPY001 is a novel humanized monoclonal IgG1 demonstrating high affinity for α4β7 and potent, selective inhibition of the α4β7/MAdCAM-1 interaction.
• SPY001 offers the potential for effective and safe treatment of CD and UC as a monotherapy or combination backbone, with the advantage of infrequent SC dosing.
